

The Laborers Union

Protecting the Environment

Training for the Future

► Trenchless Technology

The inspection, repair and rehabilitation of sewer and water lines without excavation can improve water quality and sewage processing while using less materials and equipment than traditional methods.

- The Minnesota Laborers Training Center is the National Training Center for Trenchless Technology

► Pipeline Safety

Pipeline safety training helps Laborers Union members working on natural gas and petroleum pipeline construction to ensure the least environmental impact possible from the construction of new energy pipelines including:

- Proper locating techniques, site grading, and dewatering techniques
- Pipe preparation, leak detection, testing and cathodic protection

► Environmental Remediation

The Laborers Union has historically served as the clean-up crew of the construction industry including hazardous waste removal, brown field clean-up, and asbestos and lead abatement.

► Green Materials

The Construction Laborers Training Center and the Laborers Union are at the forefront of adopting newer sustainable construction methods including the proper applications of greener aggregate products, sealants, and other materials.
